

THREE-DIMENSIONAL SHAPES

A THREE-DIMENSIONAL SHAPES

Definition Solid Geometry

Solid geometry studies **three-dimensional shapes**, such as cubes, cylinders, and spheres. The diagrams show examples of these shapes.

Definition Surface

A **surface** is the exterior of a three-dimensional shape.

Definition Face

A **face** is a flat surface of a three-dimensional shape.

Definition Edge

An **edge** is a line segment where two faces meet.

Definition Vertex

A **vertex** is a point where two or more edges meet.

Ex:

B DRAWING THREE-DIMENSIONAL SHAPES

Method Drawing 3D Shapes

When drawing 3D shapes, some edges are hidden because they are at the back of the shape. We call these **hidden edges**. To show the shape clearly, we use dotted lines for hidden edges. This helps us see the shape and its depth.

C CLASSIFICATION

Definition Classification

Name	Shape	Faces	Edges	Vertices
Cube		6 (flat)	12	8
Sphere		1 (curved)	0	0
Square Pyramid		5 (flat)	8	5
Cylinder		3 (2 curved, 1 flat)	0	0

D MULTI-VIEW PROJECTION

Definition Multi-view Projection

A **multi-view projection** is a way to draw a 3D shape using 2D views. You show how the shape looks from different sides, like the front, right, and top, to help understand its form.

Ex: Draw the front, right, and top views of this solid.

Answer:

1. Front view:
