

# FUNCTION TRANSFORMATIONS

## A TRANSLATION

### A.1 TRANSLATING GRAPHS VERTICALLY

**Ex 1:**  For the functions  $f(x) = x$  and  $g(x) = x + 3$ :

1. On the same set of axes, sketch the graphs of  $f$  and  $g$ . (You may fill in a table of values for  $x = -3, -2, -1, 0, 1, 2, 3$ .)
2. Find the geometrical transformation between these two graphs.

2. The graph of  $g$  is obtained by translating the graph of  $f$  by the vector  $\begin{pmatrix} 0 \\ 3 \end{pmatrix}$ . This is a **vertical translation** upward by 3 units, because  $g(x) = f(x) + 3$ .

**Ex 2:**  For the functions  $f(x) = x^2$  and  $g(x) = x^2 + 2$ :

1. On the same set of axes, sketch the graphs of  $f$  and  $g$ . (You may fill in a table of values for  $x = -3, -2, -1, 0, 1, 2, 3$ .)
2. Find the geometrical transformation between these two graphs.

*Answer:*

1. Fill in the table of values:

$x$	-3	-2	-1	0	1	2	3
$f(x)$	-3	-2	-1	0	1	2	3
$g(x)$	0	1	2	3	4	5	6

Plot the points and draw both lines:

*Answer:*

1. Fill in the table of values:

$x$	-3	-2	-1	0	1	2	3
$f(x)$	9	4	1	0	1	4	9
$g(x)$	11	6	3	2	3	6	11

Plot the points and draw the two parabolas:

2. The graph of  $g$  is obtained by translating the graph of  $f$  by the vector  $\begin{pmatrix} 0 \\ 2 \end{pmatrix}$ . This is a **vertical translation** upward by 2 units, because  $g(x) = f(x) + 2$ .

**Ex 3:**  For the functions  $f(x) = \frac{4}{1+x^2}$  and  $g(x) = \frac{4}{1+x^2} + 3$  :

- On the same set of axes, sketch the graphs of  $f$  and  $g$ . (You may fill in a table of values for  $x = -3, -2, -1, 0, 1, 2, 3$ .)
- Find the geometrical transformation between these two graphs.

Answer:

1. Fill in the table of values:

$x$	-3	-2	-1	0	1	2	3
$f(x)$	0.4	0.8	2	4	2	0.8	0.4
$g(x)$	3.4	3.8	5	7	5	3.8	3.4

Plot the points and draw both curves :

2. The graph of  $g$  is obtained by translating the graph of  $f$  by the vector  $\begin{pmatrix} 0 \\ 3 \end{pmatrix}$ . This is a **vertical translation** upward by 3 units, because  $g(x) = f(x) + 3$ .

**Ex 4:**  For the functions  $f(x) = -(x-2)(x+2)$  and  $g(x) = -(x-2)(x+2) - 2$  :

- On the same set of axes, sketch the graphs of  $f$  and  $g$ . (You may fill in a table of values for  $x = -3, -2, -1, 0, 1, 2, 3$ .)
- Find the geometrical transformation between these two graphs.

Answer:

1. Fill in the table of values:

$x$	-3	-2	-1	0	1	2	3
$f(x)$	-5	0	3	4	3	0	-5
$g(x)$	-7	-2	1	2	1	-2	-7

Plot the points and draw both parabolas :

2. The graph of  $g$  is obtained by translating the graph of  $f$  by the vector  $\begin{pmatrix} 0 \\ -2 \end{pmatrix}$ . This is a **vertical translation** downward by 2 units, so  $g(x) = f(x) - 2$ .

2. The graph of  $g$  is obtained by translating the graph of  $f$  by the vector  $\begin{pmatrix} 3 \\ 0 \end{pmatrix}$ . This is a **horizontal translation** to the right by 3 units, because  $g(x) = f(x - 3)$ .

## A.2 TRANSLATING GRAPHS HORIZONTALLY

**Ex 5:** For the functions  $f(x) = x^2$  and  $g(x) = (x - 3)^2$ :

- On the same set of axes, sketch the graphs of  $f$  and  $g$ . (You may fill in a table of values for  $x = -1, 0, 1, 2, 3, 4, 5$ .)
- Find the geometrical transformation between these two graphs.

**Ex 6:** For the functions  $f(x) = x^2$  and  $g(x) = (x + 2)^2$ :

- On the same set of axes, sketch the graphs of  $f$  and  $g$ . (You may fill in a table of values for  $x = -4, -3, -2, -1, 0, 1, 2$ .)
- Find the geometrical transformation between these two graphs.

Answer:

- Fill in the table of values:

$x$	-4	-3	-2	-1	0	1	2
$f(x)$	16	9	4	1	0	1	4
$g(x)$	4	1	0	1	4	9	16

Plot the points and draw the two parabolas:

- Fill in the table of values:

$x$	-1	0	1	2	3	4	5
$f(x)$	1	0	1	4	9	16	25
$g(x)$	16	9	4	1	0	1	4

Plot the points and draw both curves:

2. The graph of  $g$  is obtained by translating the graph of  $f$  by the vector  $\begin{pmatrix} -2 \\ 0 \end{pmatrix}$ . This is a **horizontal translation** to the left by 2 units, because  $g(x) = f(x+2)$ .

**Ex 7:** For the functions  $f(x) = \frac{4}{1+x^2}$  and  $g(x) = \frac{4}{1+(x-2)^2}$  :

- On the same set of axes, sketch the graphs of  $f$  and  $g$ . (You may fill in a table of values for  $x = -2, -1, 0, 1, 2, 3, 4$ .)
- Find the geometrical transformation between these two graphs.

Answer:

- Fill in the table of values:

$x$	-2	-1	0	1	2	3	4
$f(x)$	0.8	2	4	2	0.8	0.4	0.24
$g(x)$	0.24	0.4	0.8	2	4	2	0.8

Plot the points and draw both curves :

- The graph of  $g$  is obtained by translating the graph of  $f$  by the vector  $\begin{pmatrix} 2 \\ 0 \end{pmatrix}$ . This is a **horizontal translation** to the right by 2 units, because  $g(x) = f(x-2)$ .

## B DILATION

### B.1 DILATING GRAPHS VERTICALLY

**Ex 8:** For the functions  $f(x) = x$  and  $g(x) = 2x$  :

- On the same set of axes, sketch the graphs of  $f$  and  $g$ . (You may fill in a table of values for  $x = -3, -2, -1, 0, 1, 2, 3$ .)
- Find the geometrical transformation between these two graphs.

Answer:

- Fill in the table of values:

$x$	-3	-2	-1	0	1	2	3
$f(x)$	-3	-2	-1	0	1	2	3
$g(x)$	-6	-4	-2	0	2	4	6

Plot the points and draw both lines :

2. The graph of  $g$  is obtained by vertically stretching (dilating) the graph of  $f$  by a factor of 2, because  $g(x) = 2f(x)$ .

2. The graph of  $g$  is obtained by vertically stretching (dilating) the graph of  $f$  by a factor of 4, because  $g(x) = 4f(x)$ .

**Ex 9:**  For the functions  $f(x) = \frac{x}{2}$  and  $g(x) = 2x$  :

- On the same set of axes, sketch the graphs of  $f$  and  $g$ . (You may fill in a table of values for  $x = -3, -2, -1, 0, 1, 2, 3$ .)
- Find the geometrical transformation between these two graphs.

**Ex 10:**  For the functions  $f(x) = x^2$  and  $g(x) = \frac{x^2}{2}$  :

- On the same set of axes, sketch the graphs of  $f$  and  $g$ . (You may fill in a table of values for  $x = -3, -2, -1, 0, 1, 2, 3$ .)
- Find the geometrical transformation between these two graphs.

Answer:

1. Fill in the table of values:

$x$	-3	-2	-1	0	1	2	3
$f(x)$	-1.5	-1	-0.5	0	0.5	1	1.5
$g(x)$	-6	-4	-2	0	2	4	6

1. Fill in the table of values:

$x$	-3	-2	-1	0	1	2	3
$f(x)$	9	4	1	0	1	4	9
$g(x)$	4.5	2	0.5	0	0.5	2	4.5

Plot the points and draw both lines :

Plot the points and draw both parabolas :

2. The graph of  $g$  is obtained by vertically compressing (dilating) the graph of  $f$  by a factor of  $\frac{1}{2}$ , because  $g(x) = \frac{1}{2}f(x)$ .

2. The graph of  $g$  is obtained by horizontally compressing the graph of  $f$  by a factor of  $\frac{1}{2}$ , because  $g(x) = f(2x)$ . A point  $(x, y)$  on the graph of  $f$  is mapped to  $(\frac{x}{2}, y)$  on the graph of  $g$ . For example, the point  $(2, 4)$  on  $f$  moves to  $(1, 4)$  on  $g$ .

## B.2 DILATING GRAPHS HORIZONTALLY

**Ex 11:** For the functions  $f(x) = x^2$  and  $g(x) = (2x)^2$ :

- On the same set of axes, sketch the graphs of  $f$  and  $g$ .
- Find the geometrical transformation that maps the graph of  $f$  to the graph of  $g$ .

Answer:

- Fill in a table of values:

$x$	-2	-1	0	1	2
$f(x) = x^2$	4	1	0	1	4
$g(x) = (2x)^2$	16	4	0	4	16

Plot the points and draw both curves:

**Ex 12:** For the functions  $f(x) = x^2$  and  $g(x) = (\frac{1}{2}x)^2$ :

- On the same set of axes, sketch the graphs of  $f$  and  $g$ .
- Find the geometrical transformation that maps the graph of  $f$  to the graph of  $g$ .

Answer:

- Fill in a table of values:

$x$	-2	-1	0	1	2
$f(x) = x^2$	4	1	0	1	4
$g(x) = (\frac{1}{2}x)^2$	1	0.25	0	0.25	1

Plot the points and draw both curves:

2. The graph of  $g$  is obtained by horizontally stretching the graph of  $f$  by a factor of 2, because  $g(x) = f(\frac{1}{2}x)$ . A point  $(x, y)$  on the graph of  $f$  is mapped to  $(2x, y)$  on the graph of  $g$ . For example, the point  $(1, 1)$  on  $f$  moves to  $(2, 1)$  on  $g$ .

## C REFLECTION

### C.1 REFLECTING GRAPHS

**Ex 13:** For the functions  $f(x) = x - 1$  and  $g(x) = -(x - 1)$  :

- On the same set of axes, sketch the graphs of  $f$  and  $g$ . (You may fill in a table of values for  $x = -3, -2, -1, 0, 1, 2, 3$ .)
- Find the geometrical transformation between these two graphs.

Answer:

- Fill in the table of values:

$x$	-3	-2	-1	0	1	2	3
$f(x)$	-4	-3	-2	-1	0	1	2
$g(x)$	4	3	2	1	0	-1	-2

Plot the points and draw both lines :

- The graph of  $g$  is obtained by reflecting the graph of  $f$  over the  $x$ -axis (symmetry about the  $x$ -axis) because  $g(x) = -f(x)$ .

**Ex 14:** For the functions  $f(x) = x - 1$  and  $g(x) = -x - 1$  :

- On the same set of axes, sketch the graphs of  $f$  and  $g$ . (You may fill in a table of values for  $x = -3, -2, -1, 0, 1, 2, 3$ .)
- Find the geometrical transformation between these two graphs.

Answer:

- Fill in the table of values:

$x$	-3	-2	-1	0	1	2	3
$f(x)$	-4	-3	-2	-1	0	1	2
$g(x)$	2	1	0	-1	-2	-3	-4

Plot the points and draw both lines :

2. The graph of  $g$  is obtained by reflecting the graph of  $f$  over the  $y$ -axis (symmetry about the  $y$ -axis), because  $g(x) = f(-x)$ .

## D COMBINING TRANSFORMATIONS

### D.1 APPLYING COMBINED TRANSFORMATIONS

**Ex 15:** The graph of  $y = f(x)$  is shown. On the same axes, sketch the graph of  $y = f(x + 1) - 2$ .

*Answer:* The transformation  $y = f(x + 1) - 2$  involves two steps:

1. A horizontal translation of 1 unit to the left ( $x + 1$ ).
2. A vertical translation of 2 units down ( $-2$ ).

We apply these transformations to the key points of the original graph:

- $(-2, -1) \xrightarrow{\text{left 1, down 2}} (-3, -3)$
- $(0, 2) \xrightarrow{\text{left 1, down 2}} (-1, 0)$
- $(2, -1) \xrightarrow{\text{left 1, down 2}} (1, -3)$

Plotting the new points gives the transformed graph.

**Ex 16:** The graph of  $y = f(x)$  is shown. On the same axes, sketch the graph of  $y = 2f(x - 1)$ .

*Answer:* The transformation  $y = 2f(x - 1)$  involves two steps, applied in order:

1. A horizontal translation of 1 unit to the right ( $x - 1$ ).
2. A vertical stretch by a factor of 2 ( $2f(\dots)$ ).

We apply these transformations to the key points:

- $(-1, 2) \xrightarrow{\text{right 1}} (0, 2) \xrightarrow{\text{stretch vert by 2}} (0, 4)$
- $(1, -1) \xrightarrow{\text{right 1}} (2, -1) \xrightarrow{\text{stretch vert by 2}} (2, -2)$
- $(3, 1) \xrightarrow{\text{right 1}} (4, 1) \xrightarrow{\text{stretch vert by 2}} (4, 2)$

Plotting the new points gives the transformed graph.

**Ex 17:** The graph of  $y = f(x)$  is shown. On the same axes, sketch the graph of  $y = -f(x) + 1$ .

*Answer:* The transformation  $y = -f(x) + 1$  involves two vertical transformations:

1. A reflection in the  $x$ -axis ( $-f(x)$ ).

2. A vertical translation of 1 unit up (+1).

We apply these transformations to the key points of the original graph:

- $(-2, -1) \xrightarrow{\text{reflect in x-axis}} (-2, 1) \xrightarrow{\text{up } 1} (-2, 2)$
- $(0, 3) \xrightarrow{\text{reflect in x-axis}} (0, -3) \xrightarrow{\text{up } 1} (0, -2)$
- $(2, -1) \xrightarrow{\text{reflect in x-axis}} (2, 1) \xrightarrow{\text{up } 1} (2, 2)$

Plotting the new points gives the transformed graph.

**Ex 18:** The graph of  $y = f(x)$  is shown. On the same axes, sketch the graph of  $y = f(2x) - 1$ .

*Answer:* The transformation  $y = f(2x) - 1$  involves two steps:

1. A horizontal dilation by a factor of  $\frac{1}{2}$  ( $f(2x)$ ).
2. A vertical translation of 1 unit down ( $-1$ ).

We apply these transformations to the key points:

- $(-4, 2) \xrightarrow{\text{horiz dilation by } 1/2} (-2, 2) \xrightarrow{\text{down } 1} (-2, 1)$
- $(-2, -1) \xrightarrow{\text{horiz dilation by } 1/2} (-1, -1) \xrightarrow{\text{down } 1} (-1, -2)$
- $(2, -1) \xrightarrow{\text{horiz dilation by } 1/2} (1, -1) \xrightarrow{\text{down } 1} (1, -2)$
- $(4, 2) \xrightarrow{\text{horiz dilation by } 1/2} (2, 2) \xrightarrow{\text{down } 1} (2, 1)$

Plotting the new points gives the transformed graph.

## D.2 FINDING EQUATIONS FROM A SEQUENCE OF TRANSFORMATIONS

**Ex 19:** Consider a function  $y = f(x)$ . Find the equation of the resulting function,  $g(x)$ , if the graph of  $f$  is transformed by the following sequence:

1. A reflection in the  $y$ -axis.
2. A horizontal stretch by a factor of 2.

*Answer:* We apply the transformations step-by-step to the initial function  $y = f(x)$ .

1. **Reflection in the  $y$ -axis:**

This transformation replaces  $x$  with  $-x$ . The function becomes:  $y = f(-x)$ .

2. **Horizontal stretch by a factor of 2:**

This transformation replaces  $x$  with  $\frac{x}{2}$  in the current function. We apply this to the result from step 1. The function becomes:  $y = f\left(-\frac{x}{2}\right)$ .

The final function is  $g(x) = f\left(-\frac{x}{2}\right)$ .

**Ex 20:** Consider a function  $y = f(x)$ . Find the equation of the resulting function,  $g(x)$ , if the graph of  $f$  is transformed by the following sequence:

1. A vertical stretch by a factor of 3.
2. A reflection in the  $x$ -axis.

*Answer:* We apply the transformations step-by-step to the initial function  $y = f(x)$ .

1. **Vertical stretch by a factor of 3:**

This transformation multiplies the entire function by 3. The function becomes:  $y = 3f(x)$ .

2. **Reflection in the  $x$ -axis:**

This transformation multiplies the current function by  $-1$ . We apply this to the result from step 1. The function becomes:  $y = -(3f(x))$ .

The final function is  $g(x) = -3f(x)$ .

**Ex 21:** Consider a function  $y = f(x)$ . Find the equation of the resulting function,  $g(x)$ , if the graph of  $f$  is transformed by the following sequence:

1. A horizontal translation of 5 units to the left.
2. A horizontal compression by a factor of  $\frac{1}{2}$ .

*Answer:* We apply the transformations step-by-step to the initial function  $y = f(x)$ .

1. **Horizontal translation of 5 units to the left:**

This transformation replaces  $x$  with  $(x + 5)$ . The function becomes:  $y = f(x + 5)$ .

2. **Horizontal compression by a factor of  $\frac{1}{2}$ :**

This transformation replaces  $x$  with  $2x$  in the current function. We apply this to the result from step 1. The function becomes:  $y = f((2x) + 5)$ .

The final function is  $g(x) = f(2x + 5)$ .
